

XtendM3 Code Review Report

Extension: EXT200MI.AddULReport

Overall Review Status

Status: Corrections Recommended Before Approval.

Positive Observations

- README section is available and explains the purpose, logic overview, and process notes.
- Change history is maintained.
- Company, Division, Warehouse, Item, Lot, User and Date validations are implemented.
- Existing records are updated and new records are inserted correctly.
- Audit fields are maintained properly.

Major Findings

1. Mandatory Input Fields Are Not Null Safe

CONO, ITNO, FPQT, ULTY and USER are trimmed directly from input without null checks. Missing values may cause runtime exceptions.

2. Numeric Parsing Without Validation

CONO, FPQT and NOLP are parsed directly using Integer.parseInt and Double.parseDouble without validating the contents first.

3. FPQT Used in Index 00

EXFPQT participates in Index 00. Precision handling should be reviewed to ensure consistent record retrieval and updates.

Medium Findings

1. ULTY Validation Missing

ULTY is now part of Index 00 but blank-value validation is not implemented.

2. NOLP Positive Value Validation Missing

Zero or negative values can be processed and may lead to incorrect print counts.

3. FPQT Positive Value Validation Missing

Zero or negative quantity values are currently allowed.

4. Printer Validation Not Available

PRTR is stored without validation. Verify whether business rules require printer validation.

Approval Checklist

README Available - Passed
Compilation Readiness - Passed
Company Validation - Passed
Division Validation - Passed
Warehouse Validation - Passed
Item Validation - Passed
Lot Validation - Passed
User Validation - Passed
Date Validation - Passed
Mandatory Field Validation - Needs Improvement
Numeric Validation - Needs Improvement
ULTY Validation - Needs Improvement
NOLP Validation - Needs Improvement
FPQT Validation - Needs Improvement
EXFPQT Precision Review - Needs Review

Final Recommendation

Approval Status: Not Approved.

Required corrections include mandatory field validations, numeric validations, ULTY validation, NOLP validation, FPQT validation, and confirmation of EXFPQT precision handling.
